CRT: Candle Ranges Theory

A detailed thread explaining everything about CRT. 

- Origin - Theory - Advance Protocols - Conjunction of CRT - Trade ideas - Filtering CRT - Application.

Let it be known that everything else is inferior.

Credits: @Romeotpt

The origins of CRT:

There's considerable debate about the true authorship of CRT, yet the answer is unequivocal: it is @Romeotpt.

Aside from R, the only secondary source for CRT is @SpeculatorFL [Me] and few chefs.

Anyone else claiming to know anything about CRT is fully lying

The origins of CRT:

There's considerable debate about the true authorship of CRT, yet the answer is unequivocal: it is @Romeotpt

@Romeotpt is the individual who conceived and developed this theory to its current form.

You might wonder why knowing the authentic author matters. The rationale is straightforward: identifying the genuine author ensures accessing the primary source of CRT. Without this, reliance on unofficial and unauthorized sources risks misinterpretation and you'd be lost. Moreover, giving credit where it's due is a fundamental principle in scholarly discourse.

Aside from Romeo, the only secondary source for CRT is @SpeculatorFL [Me] and a few chiefs.

Anyone else claiming to know anything about CRT is fully lying for personal gains.

I have compiled all the fragments of CRT into a single comprehensive thread.

The YouTube video I promised is still in progress and will be uploaded in late May.

Until then, study this thread diligently.

<https://www.youtube.com/@SpeculatorFL>

The first instance of Romeo discussing CRT occurred in his tweets and courses, where fragments of CRT theories and applications were dispersed across his Twitter content, Telegram, and UTS.

For over three years, he has delved into its intricate protocols and practical applications.

I have meticulously compiled all these fragments into a single comprehensive thread.

The YouTube video I promised is still in progress and will be uploaded in May.

Until then, study this thread diligently.

CRT Core Concept and Theory:

The fundamental theory and concept of CRT can be summarized as "Every single candle is a range."

Each candle, similar to a conventional range, possesses both H/L along with fixed O/C prices.

CRT Core Concept

CRT Core Concept:

The fundamental theory and concept of CRT can be summarized as "Every single candle is a range."

This notion implies that each candle, similar to a conventional range, possesses both highs and lows along with fixed opening and closing prices. Understanding this, one can regard each candle as a range and leverage it to form a bias, gauge liquidity, or generate trading ideas.

Furthermore, according to CRT every candle harbors its own PO3 [Power of 3] or AMD.

By capitalizing on this understanding, we can exploit the range of each candle using specific protocols during the manipulation or distribution phase

- Accumulation
- Manipulation
- Distribution.

CRT x P03

HTF Key Level

You need to realize P03 can be applied to every single candle.
It gives you a logical conceptual insight to the candle.

Distinguishing CRT from Typical Ranges:

Many people question how CRT differs from typical ranges. The answer lies in several key points: (See Picture)

- Objectivity
- Feasibility
- Technicality
- Mechanical
- Simple
- Refined
- Innovated
- Scalable.

Distinguishing CRT from Typical Ranges:

Many people question how CRT differs from typical ranges. The answer lies in several key points:

- Typical ranges are subjective, whereas CRT is objective.
- Typical ranges may be impractical, but CRT is feasible and tradable.
- Typical ranges may be outdated, while CRT is refined and innovative.
- Typical ranges can be complex, whereas CRT is simple yet effective.
- Typical ranges don't have opening and closing prices, CRT does.

Furthermore, CRT is characterized by its mechanical and objective nature, making it readily adaptable into personalized models with fixed and specific protocols.

Simplicity Scales, Complexity Fails.

Utilizing CRT Effectively:

The proper approach to leveraging CRT for identifying trade ideas involves integrating it with TSQ (The Sequence) and Turtle Soup.

The phases of TSQ include:

- CRT Turtle Soup
- CSD
- OTE
- Continuation
- KOD (Kiss of Death)
- Turtle Soup

Utilizing CRT Effectively:

The proper approach to leveraging CRT for identifying trade ideas involves integrating it with TSQ (The Sequence) and Turtle Soup.

For those unfamiliar with TSQ, it stands for The Sequence, which presents a method to trade higher timeframe CRT Ranges on lower timeframes using specific protocols.

TSQ consists of various phases offering both reversal and multiple continuation entries within a higher timeframe CRT setup.

The phases of TSQ include:

- CRT Turtle Soup
- CSD (Change in State of Delivery)
- OTE (Optimal Trade Entry)
- Continuation
- KOD (Kiss of Death)
- CRT Opposing Turtle Soup

CRT x TSQ

Combining CRT with TSQ:

Integrating CRT with TSQ not only simplifies and objectify your entries on lower timeframes but also eliminates complexities often encountered in lower timeframe entries while trading.

"Everything begins with a TS, everything ends with a TS"

Combining CRT with TSQ:

Integrating CRT with TSQ not only simplifies and objectify your entries on lower timeframes but also eliminates complexities often encountered in lower timeframe entries while trading.

Many traders struggle with identifying the ideal model for their entries on lower timeframes, which poses a significant challenge. TSQ solves this challenge by offering a sequence of straightforward and efficient entry phases, complete with specific protocols.

Selecting the Right CRT:

Technically, any candle can be considered a CRT. However, to pinpoint the most accurate and precise CRT, several protocols should be followed.

I will elaborate on some of these protocols in detail to empower you to choose the right CRT independently.

One of the most common questions surrounding CRT is "which CRT to choose?" The answer, while simple in principle, entails a bunch of intricacies and protocols to consider. To make an informed decision in choosing the correct CRT, you must adhere to a sound logical approach.

Technically, any candle can be considered a CRT. However, to pinpoint the most accurate and precise CRT, several protocols should be followed:

- Integrating LTF CRT with HTF CRT
- Inside bars within CRT
- CRT formations at specific times
- Key levels around CRT
- Pairing different CRT with each other
- Incorporating market profiles with CRT

Selecting the Right CRT:

These intermediate-level protocols aid in selecting the correct CRT. I will elaborate on some of these protocols in detail to empower you to choose the right CRT independently.

These are some of the most intricate and significant protocols:

- LTF CRT with HTF CRT
- Inside bars within CRT
- CRT formed at specific times
- Key levels around CRT
- Pairing different CRT
- Market profile with CRT

Inside Bars within CRT:

This protocol holds significant importance within CRT. Inside bars appearing within a CRT represents the accumulation of interest around CRT.

The greater the number of inside bars, the better the CRT.

Inside Bars within CRT:

This protocol holds significant importance within CRT. Inside bars appearing within a CRT represents the accumulation of interest around CRT. The presence of a greater number of inside bars correlates with a higher-quality CRT and suggests a potential for more explosive expansions and purges.

Moreover, inside bar candles elevate the probability of a CRT unfolding accurately. They indicate a phase of accumulation followed by manipulation, aiding in the identification of which side might potentially undergo purging.

When multiple inside bars occur within a CRT, the strategy is straightforward:

Await for a purge of one side. Once either side is purged, it provides a potential bias and draws liquidity toward the opposite 50% of the range or the opposing end of the range.

When multiple inside bars occur within a CRT, the strategy is straightforward: await a purge of one side. Once either side is purged, it provides a potential bias and draws liquidity toward the opposite 50% of the range or the opposing end of the range.

This method offers a simple yet effective means of identifying bias and drawing on liquidity. It can be more helpful than any other concept out there.

This is something that's not recommended to use alone but to use it cohesively with the other protocols.

However, for those seeking a more accurate, precise, and comprehensive approach, it's recommended to utilize this protocol in conjunction with other protocols within CRT.

In this example, multiple inside bar candles can be seen within the CRT, contributing to a more explosive expansion towards the opposing end of the range once one side was purged.

Furthermore, after the CRH was purged, it started its journey toward the other 50% of the range and eventually the opposing end.

This could have significantly helped you with your bias and DOL.

This is how you determine bias and DOL in a nutshell.

You then couple it with the other protocols.

Another example.

Another enhancement to the inside bars protocol involves waiting for a CSD to occur on the timeframe below it. This additional step provides a more accurate and high probability bias and drawing on liquidity.

This one extra step alone increases the probability by 50% margin.

(HTF)

Another enhancement to the inside bars protocol involves waiting for a CSD to occur on the timeframe below it. This additional step provides a more accurate and high probability bias and drawing on liquidity.

This one extra step alone increases the probability of a CRT by 50% margin.

(LTF)

Waiting for a CSD to occur means you're confirming the purge and the probability of the CRT increases by a lot of margin.

(You should always use this in conjunction with the other protocols)

(HTF)

- Wait one side to be purged.
- Go down to the LTF.
- Wait for CSD/OB to occur.
- That confirms the purge.
- Target the opposing end of the range.

(LTF)

Key levels around CRT serve as catalysts for reactions and expansion to the opposing end of the range. The hierarchy of key levels, from highest to lowest quality, includes:

- Rejection blocks.
- Orderblocks
- Fair value gaps
- Breakers

Key levels around CRT serve as catalysts for reactions and expansion to the opposing end of the range. Identifying these levels involves a specific hierarchy, found on a higher timeframe than the one used for finding CRT. For instance, if using H4 for CRT, Daily timeframe is used for finding key level, aligning timeframes. The hierarchy of key levels, from highest to lowest quality, includes:

- Rejection blocks: These form after a protected low, making them particularly strong when coupled with CRT.
- Orderblocks
- Fair value gaps
- Breakers

Rejection blocks, formed after a protected low, are particularly strong when coupled with CRT due to their higher success rate. Other key levels, such as orderblocks, fair value gaps, and breakers, are also effective choices for CRT.

- Rejection blocks (RJB)
- Orderblocks (OB)
- Fair value gaps (FVG)
- Breakers (BRK)

Example:

If you're using H4 for finding CRT, then you must use the daily timeframe for coupling key levels with it.

Similarly, if you're using the daily for finding CRT, then you use the weekly timeframe for coupling key levels with it.

I'll delve further into it on my YT.

(LTF) for finding CRT
(H4)

(HTF) for coupling key level with it
(Daily)

Examples:

- If you're using H4 for CRT, then use Daily for key level
- Daily for CRT, then Weekly for key level
- Weekly for CRT, then Monthly for key level

This is called timeframe alignment, It can be brought down to the lower timeframes as well.

Combining [Inside bars] and [Key level]:

By combining the first two protocols, we can elevate our CRT's quality to a more advanced level, resulting in better accuracy and precision.

As we incorporate additional protocols , the quality of our CRT continues to improves.

Combining [Inside bars] and [Key level]

By combining the first two protocols, we can elevate our CRT's quality to a more advanced level, resulting in better accuracy and precision.

Integrating the inside bar protocol with the key level protocol allows us to enhance the quality of our CRT even further.

As we incorporate additional protocols in our analysis, the quality of our CRT continues to improve, offering higher levels of accuracy and precision.

Protocol #1 and Protocol #2 Combined

CRT formed at specific times:

As we all know, Time > Price.

This core principle guides our trading decisions, focusing on specific times of the day or week. By recognizing the importance of time over price, we can filter out less accurate CRTs and select higher-quality ones.

CRT formed at specific times.

As we all know, time holds more significance than price. This core principle guides our trading decisions, focusing on specific times of the day or week. By recognizing the importance of time over price, we can filter out less accurate CRTs and select higher-quality ones.

These specific times vary, ranging from daily and weekly intervals to intraday hours. For intraday trading, the H4 timeframe is optimal. Therefore, we should seek H4 CRTs formed at specific times of the day.

You may have heard of the 159 or 369 analogy, which is crucial for identifying CRTs at specific times. The daily candle is divided into six H4 candles, each potentially serving as a CRT if it meets all criteria. The most accurate and precise CRTs typically form at 9 PM EST, 1 AM EST, and 5 AM EST. These three H4 candles represent high-probability CRT ranges for intraday trading.

Additionally, there are specific times of the day for CRT purges. High-probability purges often occur at 1 AM EST, 3 AM EST, 6 AM EST, and 9 AM EST. Recognizing these times allows traders to filter out lower-quality purges. If a CRT purge occurs at these specific times, following all other protocols, it indicates a high-quality CRT range. We can then anticipate price movement to take out the opposing end of the CRT, providing a bias and draw of liquidity (DQL).

Timing of CRT Purges:

Just as high-quality CRTs form at specific times, high-quality purges of CRT ranges also occur at specific times.

This illustrates the synergy between time and CRT analysis. We can apply the 159 and 369 analogy here to enhance your understanding.

Pairing multiple CRT:

I've already provided a wealth of protocols, and here's another fantastic one to add to the mix: pairing different CRTs within the same timeframe.

Pairing different CRT:

I've already provided a wealth of protocols, and here's another fantastic one to add to the mix: pairing different CRTs within the same timeframe. We can identify both micro and macro CRTs within the same timeframe, and the key is to analyze the macro CRT to determine which side has been purged. Then, we use that information as a bias and draw of liquidity (DOL) towards the opposing end of the macro CRT.

Once we establish this bias, we can then look for micro CRTs within the macro CRT. By applying all the other protocols alongside this approach, we can enhance our understanding of bias and DOL more effectively than ever before.

In this example, we observe a macro CRT where one side has already been purged, providing us with a bias and DOL towards the opposing end of the CRT.

As we approach this opposing end, we can search for micro CRTs within it and exploits it

CSD could also confirm the purge.

In this example,

We observe a macro CTR where one side has already been purged, providing us with a bias and direction of liquidity (DOL) towards the opposing end of the CTR range. As we approach this opposing end, we can search for micro CTRs within it. This combination of macro and micro CTR analysis works seamlessly, enhancing its effectiveness.

Using CSD to confirm Bias and DOL:

A significant protocol for CTR involves waiting for a CSD to occur on the timeframe below the one where you've identified the CTR. This step confirms your bias and DOL.

However, it's crucial to use this protocol in conjunction with the others.

Using CSD to confirm Bias and DOL:

A significant protocol for CRT involves waiting for a CSD to occur on the timeframe below the one where you've identified the CRT. This step confirms your bias and DOL towards the opposing end of the CRT range, providing a clear directional bias and draw on liquidity.

However, it's crucial to use this protocol in conjunction with other strategies and protocols. Relying solely on CSD without considering other factors could lead to pattern trading, which may not be as effective.

LTF CRT within a HTF CRT:

Using LTF CRT within a HTF CRT is one of the most frequently asked questions about CRT. This protocol allows us to establish our bias and DOL and confirms it.

LTF CRT within HTF CRT significantly enhances the quality and probability of a CRT.

LTF CRT within a HTF CRT:

(HTF)

Using LTF CRTs within a HTF CRT is one of the most frequently asked questions about CRT. This protocol is highly significant as it allows us to establish our bias and DOL and confirm it effectively.

Incorporating LTF CRTs within HTF CRTs significantly enhances the quality and probability of a CRT by a considerable margin, potentially by as much as 50%.

(LTF)

Using LTF within a HTF CRT always yields the best results.

The method involves identifying a correct HTF CRT using the provided protocols. Then, wait for one side of the CRT to be purged at the right time. After that, descend to the LTF to search for a CSD. Once the CSD occurs, it confirms your bias and provides a DOL towards the opposing 50% or end of the range. With that DOL in mind, search for an LTF CRT towards the opposing end using the provided protocols. This will give you a high probability LTF CRT to work with. You can further break this down into even more LTF CRTs, each following a sound logical approach, and they will work like a charm.

Trade Protocols for CRT:

- When one side of the CRT is purged, your first target should be the 50% level of the opposing end.
- If the CRT is of high quality, based on the protocols followed, you may opt to hold the trade longer toward the opposing end.

Here are trade protocols for CRT that you can integrate into your risk management and trade management strategies to make more informed trading decisions:

- When one side of the CRT is purged, your first target should be the 50% level of the opposing end. At this point, consider taking partial profits or closing your entire trade, depending on the perceived opportunity and adherence to CRT protocols.
- If the CRT is of high quality, based on the protocols followed, you may opt to hold the trade longer toward the opposing end. However, if it's a low-quality CRT, it's advisable to take partial profits at the 50% level because this point often represents a level of invalidation or resistance for the CRT.

The more protocols that you use to find a CRT the higher would be the quality of the CRT.

- Each protocol added, further increases the margin of quality and probability by 11%.
- Use all the protocols in a sound logical manner with all the other market profiles.

Everyone who has read till the end will have a lot to study, and this may have even made their day. Now go to the charts and study this, and reverse engineer this as much as you can.

Happy studying, and share this with everyone.

I would love to see at least 400 reposts.

TIP OF THE ICEBERG.

This is just 10% of the iceberg and what @RomeoTPI has revealed to the public. I've been privately mentored and given a lot more insight than this, but this is what I could explain to you. I don't have his permission to reveal the rest because everything has its time, and Romeo is waiting for the right time to reveal it.

Now, this doesn't mean that this alone isn't enough. This is actually a lot more than enough to boost your trading and help like you've never been helped before. This is one of the most refined and innovative concepts out there; nothing comes close to it.

Everyone who has read till the end will have a lot to study, and this may have even made their day. Now go to the charts and study this, and reverse engineer this as much as you can.

Happy studying, and share this with everyone.

I would love to see at least 400 reposts.

The video is also in the works and will be uploaded once I reach a thousand subscribers.

My point with these reposts and subscribers is just to gauge genuine interest and to see if the people are really interested in the right things.

The video is also in the works and will be uploaded in late May.

My point with these reposts is just to gauge genuine interest and to see if the people are really interested in the right things.
